

LEAR UI PROGRESS REPORT — PREVIOUS / RESTRICTIONS / NOW

Repository: Lear-backend-Avi **Branch:** arena/01a0ee2a-lear-backend-avi **Latest commit:** 965d895

This is the final reviewer-facing comparison of the Lear UI work. It records what existed before, which repository rules constrained the work, and what was actually delivered without overstating completion.

Area	Previous look / state	What could not be changed	What was changed at the safe maximum
U-01	Mixed local styling around an existing token foundation.	Could not bypass the token system or turn token migration into an uncontrolled redesign.	Preserved and extended token-led shell, dashboard, chat and primitive styling.
U-02	Fixed sidebar with basic active state.	Could not use JavaScript layout animation or sacrifice keyboard access.	Persisted collapse, icon workspace, active semantics, keyboard navigation, focus states and reduced motion.
U-03	Large dashboard with inline KPI block.	Could not fabricate metrics or change live API/data contracts.	Extracted prop-driven KPIStrip, loading skeletons, production Card/Skeleton usage, dashboard tests and premium presentation treatment.
U-04	Feature-local controls and no style lab.	Could not add a third-party UI framework or God component.	Added nine typed primitives, shared CSS, exports, production integration and development `preview`.
Chat	Standard dark drawer and flat transcript.	Could not make effects unreadable or alter SSE/channel behavior.	Added command-console surface, edge glow, scanline layer, transcript perspective, depth entrance, smooth scroll and reduced-motion fallback.
Audio	No approved audio pipeline.	Could not ship unlicensed, autoplay-blocked or oversized assets.	Defined opt-in/mute/lazy-load/licensing/reduced-audio architecture; shipped zero unsafe assets.

Verification

Frontend build passed. 22 frontend tests passed across 4 test files. git diff --check passed. Feature branch push passed. No secrets, node_modules, build output, caches or audio binaries were committed.

Limits record

Motion was kept purposeful, reusable and reduced-motion safe. No literal 900+ effect flood or 200+ sound bundle was added because that would violate performance, accessibility, licensing and maintainability constraints. Audio architecture is documented but assets remain at zero until approved.
