

LEAR UI FINAL PROGRESS REPORT

Previous → Restriction → Now → Verified → Remaining

Repository: Lear-backend-Avi Branch: arena/01a0ee2a-lear-backend-avi Latest: 4157e86

Task	Priority	Restriction	Now
U-01	Mixed visual values and token usage.	Use one token system; do not turn token migration into an uncontrolled redesign.	Token foundation preserved and used by new shell, dashboard, chat and UI primitives.
U-02	Fixed sidebar, basic active state.	Desktop, CSS motion, keyboard access and reduced-motion support.	Persisted collapse, icon mode, active semantics, keyboard navigation, focus treatment and safe transitions.
U-03	Large dashboard with inline KPI presentation.	Preserve live APIs and real data; presentation components must not fetch.	KPI extraction implemented in `dashboard/KPIStrip`, loading skeletons added, production `Card`/`Skeleton` usage added and dashboard tests added.
U-04	Local controls and no living style lab.	Typed custom primitives; no third-party UI framework; accessible behavior.	Nine primitives, shared CSS, exports and development-only `/preview` route implemented.
Chat	Standard drawer and message stack.	Preserve SSE, channels, prompts and incident context; retain readability.	Command-console surface, ambient edge glow, scanline texture, transcript perspective, depth entrance and reduced-motion fallback.

Verified

Frontend build passed. Frontend tests: 14 passed across 3 files. `git diff --check` passed. Feature branch push passed. No secrets, node_modules, build artifacts or audio binaries were committed. The existing bundle-size warning remains recorded.

Audio boundary

Audio architecture is documented in `tasks/week1/ui/audio/README.md`: opt-in, muted default, licensed manifest, lazy loading, autoplay handling, global mute, reduced-audio setting and semantic events. Current audio asset count: 0.

Actual remaining work

The requested foundation work is complete. Optional next-phase enhancements are: extract ActivityFeed, QuickActions and ConnectorOverview; add visual regression coverage and deeper data-change-only transitions; implement audio only after licensed assets and product settings are approved. These are enhancements, not missing setup requirements.
