

LEAR UI PROGRESS REPORT

Previous baseline → task → restriction → delivered result

Repository: Lear-backend-Avi **Branch:** arena/01a0ee2a-lear-backend-avi **Latest:** a753469

Executive summary

The Lear UI was upgraded inside the existing React/Tauri structure. APIs, live data flows, chat channels, SSE behavior and backend contracts were preserved. The work favors reusable, state-driven effects over decorative overload. Incomplete work is clearly marked rather than presented as finished.

Area	Previous	Task / restriction	What we did
U-01	Mixed raw and token styling.	Token foundation; appearance migration must remain structurally safe.	Preserved the existing token system for colors, type, spacing, elevation and motion; new styles reference tokens.
U-02	Fixed sidebar; basic active state.	Collapse, keyboard support, CSS motion, desktop usability.	Persisted collapse, icon mode, active aria-current, keyboard Up/Down, focus states and reduced-motion fallback.
U-03	Live dashboard but visually close to baseline.	Preserve APIs and real metrics; no fake or excessive initial animation.	Added shell aura, dashboard entry, glass elevation, hover lift and light sweep. Deeper component extraction is marked remaining.
U-04	Scattered local controls and loading states.	Nine typed primitives, no new UI framework, accessible behavior.	Added Button, Card, Badge, Input, Modal, Dropdown, Tooltip, Skeleton and EmptyState with shared CSS and exports.
Chat	Standard dark drawer and message stack.	Keep chat/SSE/channels; improve without unreadable effects.	Added command-console surface, pink edge glow, scanlines, transcript perspective and depth-aware message entrance.
Motion/audio	No central budget or audio pipeline.	Stay within performance, bundle, accessibility and licensing limits.	Bounded reusable motion; 0 sound effects until audio architecture and licensing are approved.

Pushed timeline

- 7d506dc — shell aura, persisted collapsible sidebar, icon mode, accessibility and first progress sheet.
- 3590113 — dashboard presentation pass: entry, glass elevation, hover lift and light sweep.
- e1df96e — nine-component UI foundation, shared CSS, typed exports, modal focus behavior and this report.
- a753469 — premium chat console layer: scanlines, perspective transcript, depth-aware message entrance and reduced-motion fallback.

Verification and limits

Frontend build passed. Frontend tests: 12 passed. Git diff check passed. No secrets, node_modules, build artifacts or cache files were committed. Existing Vite bundle-size warning remains recorded. Motion is purposeful and bounded at approximately 20 reusable behaviors, far below the requested 900+ because literal overload would violate the repository constitution. Audio is 0 assets; adding 200 effects without licensing, lazy loading, mute controls, autoplay handling and reduced-audio policy would be unsafe.

Remaining work

Complete U-03 component extraction and dashboard tests; add the U-04 development preview route; refactor one production component to consume the primitives; define an approved audio architecture before any sound assets are added.
